

```
1 class HtmlEntityParserJSStyle {
2
3     // JavaScript-style function inside Java
4     public static String entityParser(String text) {
5
6         // Same logic as JavaScript replace()
7         text = text.replace("&quot;", "\"");
8         text = text.replace("&apos;", "");
9         text = text.replace("&amp;", "&");
10        text = text.replace("&gt;", ">");
11        text = text.replace("&lt;", "<");
12        text = text.replace("&frasl;", "/");
13
14        return text;
15    }
16
17    static void main() {
18
19        // Example input (same as JS)
20        String input = "Tom &quot;said&quot;;x &gt;y
&amp;&amp; y &lt; z &frasl;test";
21
22        String output = entityParser(input);
23
24        System.out.println("Input: " + input);
25        System.out.println("Output: " + output);
26    }
27
28 }
29
```
